

THE LOFTS AT CITY CENTER LENEXA, KANSAS

PECORA CONTRACTOR SEALANT (PCS)

The Lofts at City Center is a new construction project located in Lenexa, Kansas. Designed by Finkle & Williams and built by Titan Construction, the structure serves as a mixed-use development combining luxury residential apartments with office space. The installer for the project, Renz Restoration, applied Pecora Contractor Sealant (PCS) to key areas of the building envelope, including exterior masonry control joints and window perimeters.

PCS was specified by the architect for this application, with the selection further supported by Pecora's longstanding relationship with Renz Restoration. The sealant was chosen for its ability to meet the project's requirements for performance, compatibility, and visual integration with the building's materials.

Color coordination played an important role in maintaining the intended aesthetic. The color Limestone was selected to match the building's masonry, while Bronze was used at window interfaces to align with the frames. This approach ensured that the sealant remained consistent with the surrounding substrates, supporting the overall architectural vision without drawing attention to the joints.

The use of PCS at The Lofts at City Center illustrates the importance of selecting appropriate sealant systems in new construction projects where both function and appearance must be addressed. For more information on PCS and other architectural silicone sealants, visit [pecora.com](https://www.pecora.com).
